MySpeidel Braumeister registration

Change a Braumeister registration from server to client mode   February 2019

Advantages:
- Braumeister is visible in the web on MySpeidel from everywhere
- Braumeister does not be in the same wifi net than the end device

Steps:
- Be sure to have 4.8.5 firmware of the wifi module on under SETTING→WIFI. You can see the version right on the top (new wifi moduls still have the firmware 4.8.5). If there still is 4.8.5 then DO NOT install again! The update process finishes with "Success". Then update again the firmware of the Braumeister with the updater the same way.
- Update your Braumeister to firmware 1.1.27 (only use this firmware or higher versions)
- Use the same wifi connection to get the Braumeister to the web
- In the wifi settings – SETTING→WIFI→REGISTER - type in your email-adress from your MySpeidel Account – all letters with small letters
- Be sure there are no empty space characters at the beginning or end of the email and if it is a mail with "-" (t-online) to use the minus instead of an also available special character which looks like minus.
- If the adress is correct it will be confirmed by OK on the control
- You will get an email from MySpeidel (please check also spam folder)

If it is the first registration:
- Click on the confirmation link
- Type/ select name and size of the Braumeister
- Braumeister information and connection is available from everywhere over MySpeidel

Change of an existing registration:
- The confirmation mail is for your information
- On MySpeidel you can see the Braumeister online and if wished can change the name of the Braumeister
- Braumeister information and connection is available from everywhere over MySpeidel

Trouble-Shooting:

1. Mobile Control shows no buttons/ run wrong recipe or is "Connecting" endless on the web control view
   - No or wrong emailadress which belongs to the MySpeidel account was written on the control (menu SETTING→WIFI→REGISTER)
   - Control unit should confirm with OK

2. Email adress on the control unit is not confirmed by OK but with ERROR
   - Emailadress is not known in a MySpeidel account
   - Wrong characters in the adress like , - . : or blank space before or after the adress
   - Only use small letters in your mailadress

3. Email with confirmation was sent and the unit is connected but it shows a red connection light on the web.
   - Check the emailadress on the control unit if there are no space characters the the beginning or end
   - Maybe some recipes with special characters cause some communication problems for the first connection. Please delete all recipes exept one and sync them on later via MySpeidel after getting a proper connection.

4. While trying to open the REGISTER lane the connection goes lost
   - Maybe some recipes with special characters cause some communication problems for the first connection. Please delete all recipes exept one and sync them on later via MySpeidel after getting a proper connection.
   - After pluging in move fast to the wifi settings and scan manual for networks or disconnect first and start a new internal wifi connection.
